Description:

This paper proposes effective methods of teaching strategies implementable to retain the attention span adaptable for different types of students during the class hours. Knowledge and wisdom could be acquired completely through basic understanding. However, active learning improves all such attributes, which is less effective in traditional learning and teaching methods. The attention span of students could be maintained consistently by involving the students in visual and sensory learning methods. This paper focuses mainly on improving the listening skills of slow learner by involving in multitasking activities. However active learning could be achieved by various brainstorming activities like think pair share, small group, large group, minutes write, concept tests, fishbowl, reciprocal peer questioning and presentations. Activity based teaching and learning methods are inculcated in very few colleges, however it would be a great success if it's being included in our Indian curriculum in order to improvise our standards and develop our learning system by emphasizing on uniqueness, innovation, team spirit and pro-activeness. These features form the base to build their career and also dwell in their professional life to become effectual engineers. These active learning strategies have been practiced in the classrooms and the outcomes are being discussed.
