Topic: Proving the Derivatives of Trigonometric Functions

Derivative of Sine Function

PROOF OF THE DERIVATIVES OF SIN(X)

IN PROVING THE DERIVATIVES OF SIN X WE WILL USE THE LIMIT DEFINITION:

$$\frac{d}{dx} \sin x = \cos x$$

$$\frac{d}{dx} \sin x$$

$$\lim_{\Delta x \rightarrow 0} \frac{\sin(x + \Delta x) - \sin x}{\Delta x}$$

$$\lim_{\Delta x \rightarrow 0} \frac{\cos x \sin \Delta x + \sin x \cos \Delta x - \sin x}{\Delta x}$$

$$\lim_{\Delta x \rightarrow 0} \frac{\cos x \sin \Delta x}{\Delta x} + \frac{\sin x \cos \Delta x - \sin x}{\Delta x}$$

$$\lim_{\Delta x \rightarrow 0} \cos x \left(\frac{\sin \Delta x}{\Delta x} \right) + \lim_{\Delta x \rightarrow 0} \sin x \left(\frac{\cos \Delta x - 1}{\Delta x} \right)$$

$$\cos x \lim_{\Delta x \rightarrow 0} \left(\frac{\sin \Delta x}{\Delta x} \right) - \sin x \lim_{\Delta x \rightarrow 0} \left(\frac{1 - \cos \Delta x}{\Delta x} \right) = \cos x(1) - \sin x(0) = \cos x$$

Derivative of Cosine Function

PROOF OF THE DERIVATIVES OF COS(X)

IN THIS PROVING WE'RE GOING TO BASED IT ON A PREVIOUS PROOF. WE MADE THAT THE DERIVATIVE WITH RESPECT TO X OF SINX IS EQUAL TO COSX.

For better understanding we will use the graph of $y = \sin(x)$ and $y = \cos(x)$ to prove that $\cos(x) = -\sin(x)$.

PROOF OF THE DERIVATIVES OF COS(X)

The red line is $y = \sin(x)$ while the blue line is $y = \cos(x)$.

- We're going to do is shifted the graphs to the left by π over 2.
- As we can see the $y = \sin(x + \pi/2)$ is at the same spot as the $y = \cos(x)$ when move the graph by $\pi/2$ which means $y = \sin(x + \pi/2)$ is equal to the equation $y = \cos(x)$.

PROOF OF THE DERIVATIVES OF COS(X)

$$\frac{d}{dx} \sin\left(x + \frac{\pi}{2}\right) = \cos\left(x + \frac{\pi}{2}\right)$$

- As we can see in the graph derivatives of $\sin(x + \pi/2)$ is also the same as $\cos(x)$ and $\cos(x + \pi/2)$ is also the same as $-\sin(x)$.
- derivatives of $\sin(x + \pi/2)$ is equal to $\cos(x + \pi/2)$ which means the derivatives of $\cos(x)$ is $-\sin(x)$.

$$\cos x = -\sin x$$

PROOF OF THE DERIVATIVES OF COS(X)

As an alternative, this is the solution in how we get the derivatives of $\cos x$.

(2) Determine the Derivative of $\cos(x)$:

$$\begin{aligned} \frac{d}{dx}(\cos x) &= \lim_{\Delta x \rightarrow 0} \left(\frac{\cos(x + \Delta x) - \cos(x)}{\Delta x} \right) \\ &= \lim_{\Delta x \rightarrow 0} \left(\frac{\cos(x)\cos(\Delta x) - \sin(\Delta x)\sin(x) - \cos(x)}{\Delta x} \right) \\ &= \lim_{\Delta x \rightarrow 0} \left(\frac{\cos(x) \cdot 1 - \sin(\Delta x)\sin(x) - \sin(x)}{\Delta x} \right) \\ &= \lim_{\Delta x \rightarrow 0} \left(\frac{-\sin(\Delta x)\sin(x)}{\Delta x} \right) \\ &= \lim_{\Delta x \rightarrow 0} (-\sin x) = -\sin x \end{aligned}$$

PROOF OF THE DERIVATIVES OF TAN(x)

In proving the derivatives of $\tan(x)$ we will use the trigonometric identity:
 $\sin^2 x + \cos^2 x = 1$.

$$\begin{aligned} \frac{d(\tan x)}{dx} &= f'(\tan x) \\ &= f'\left(\frac{\sin x}{\cos x}\right) \\ &= \frac{\cos x \sin'x - \sin x \cos'x}{\cos^2 x} \\ &= \frac{\cos x \cos x + \sin x \sin x}{\cos^2 x} \\ &= \frac{1}{\cos^2 x} = \sec^2 x \end{aligned}$$

PROOF OF THE DERIVATIVES OF COT(X)

In proving the derivatives of $\cot(x)$ we will use the trigonometric identity.

$$\begin{aligned} f(x) &= \cot x \\ &= \frac{1}{\tan x} \\ &= \frac{\cos x}{\sin x} \\ f'(x) &= \frac{\sin x \cdot -\sin x - \cos x \cdot \cos x}{\sin^2 x} \quad \text{using the Quotient Rule} \\ &= \frac{-\sin^2 x - \cos^2 x}{\sin^2 x} \\ &= \frac{-1}{\sin^2 x} \\ &= -\operatorname{cosec}^2 x \end{aligned}$$

PROOF OF THE DERIVATIVES OF SEC(X)

In proving the derivatives of $\sec(x)$ we will use the trigonometric identity.

$$\begin{aligned}
 \frac{d}{dx} \sec x &= \frac{d}{dx} (\cos x)^{-1} \\
 &= -(\cos x)^{-2} \cdot (-\sin x) \\
 &= \frac{\sin x}{\cos^2 x} \\
 &= \frac{1}{\cos x} \cdot \frac{\sin x}{\cos x} \\
 &= \sec x \tan x.
 \end{aligned}$$

PROOF OF THE DERIVATIVES OF CSC(X)

In proving the derivatives of $\csc(x)$ we will use the trigonometric identity.

Proof: $\frac{d}{dx} \csc x = -\csc x \cot x$

$$\frac{d}{dx} \csc x = \frac{d}{dx} \left(\frac{1}{\sin x} \right) \quad \left(\text{Reciprocal identity: } \csc x = \frac{1}{\sin x} \right)$$

$$\frac{d}{dx} \csc x = \frac{(\sin x)(0) - (1)(\cos x)}{\sin^2 x} \quad \left(\text{Product Rule: } \frac{d}{dx} [f(x)g(x)] = f(x)g'(x) + f'(x)g(x) \right)$$

$$\frac{d}{dx} \csc x = -\frac{\cos x}{\sin^2 x} \quad (\text{Simplified})$$

$$\frac{d}{dx} \csc x = -\left(\frac{1}{\sin x} \right) \left(\frac{\cos x}{\sin x} \right) \quad \left(\text{Reciprocal Rule: } \csc x = \frac{1}{\sin x} \text{ and Quotient Identity: } \cot x = \frac{\cos x}{\sin x} \right)$$

$$\boxed{\frac{d}{dx} \csc x = -\csc x \cot x}$$

STUDENT TASK

A. Directions: Find the derivatives of the following functions.

1. $y = \sin(8x)$

2. $y = \sin(4x^2)$

3. $y = x \sin(3x)$

4. $y = \cos(x^2 + 3)$

5. $y = x \cos(2x)$

6. $Y = \sin(5x - 2)$

7. $Y = \sin(2 - 3x^2)$

8. $Y = \cos(7x)$

9. $Y = \tan(3x)$

10. $Y = \tan(2x^3 + 5)$

B. Directions: Differentiate the following.

1. $F(x) = 5 \sec(2x) + 20$

2. $F(x) = 3 \sec(x^2) - 45$

3. $F(x) = \csc(5x^3) + 32$

4. $F(x) = \cot(2 - 4x^2)$

5. $F(x) = \cot(\sec x)$
